The Curative Role Of Surgery In Treating Patients With Thymic Tumours And Pleural Seeding

Andrey Ryabov, Oleg Pikan, Vladimir Glushko, Konstantin Kolbanov, Oleg Alexandrov, Vitaliy Barmin, Dina Martynova, Vladimir Bagrov

P. Hertsen Moscow Oncology Research Institute

Introduction

- ✓ Thymoma is the most common
- ✓ Seldom in childhood, peak incidence after 60 y.o.
- ✓ Associated with paraneoplastic syndromes

✓ In the presence of pleural seeds main goal is to achieve a total cytoreduction

Material and methods

21

patients

63%

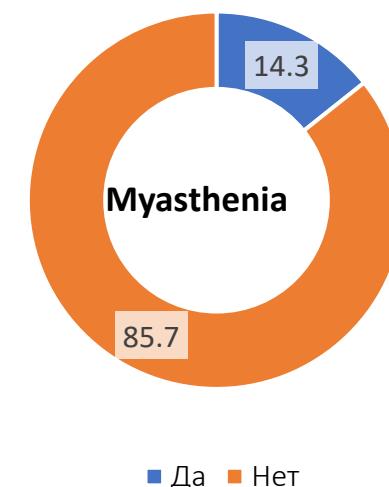

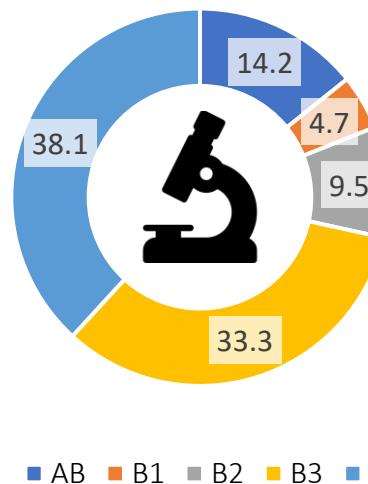

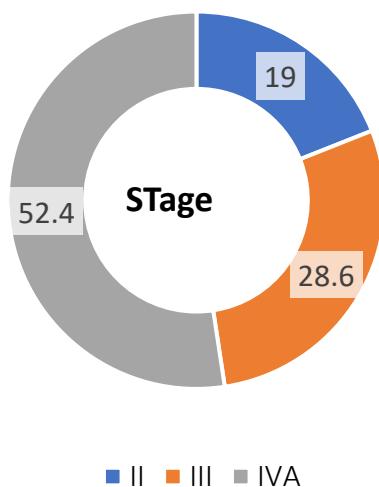

Synchronous
metastasis

37%

Metastasis as a result
of progressive disease

25 мес.

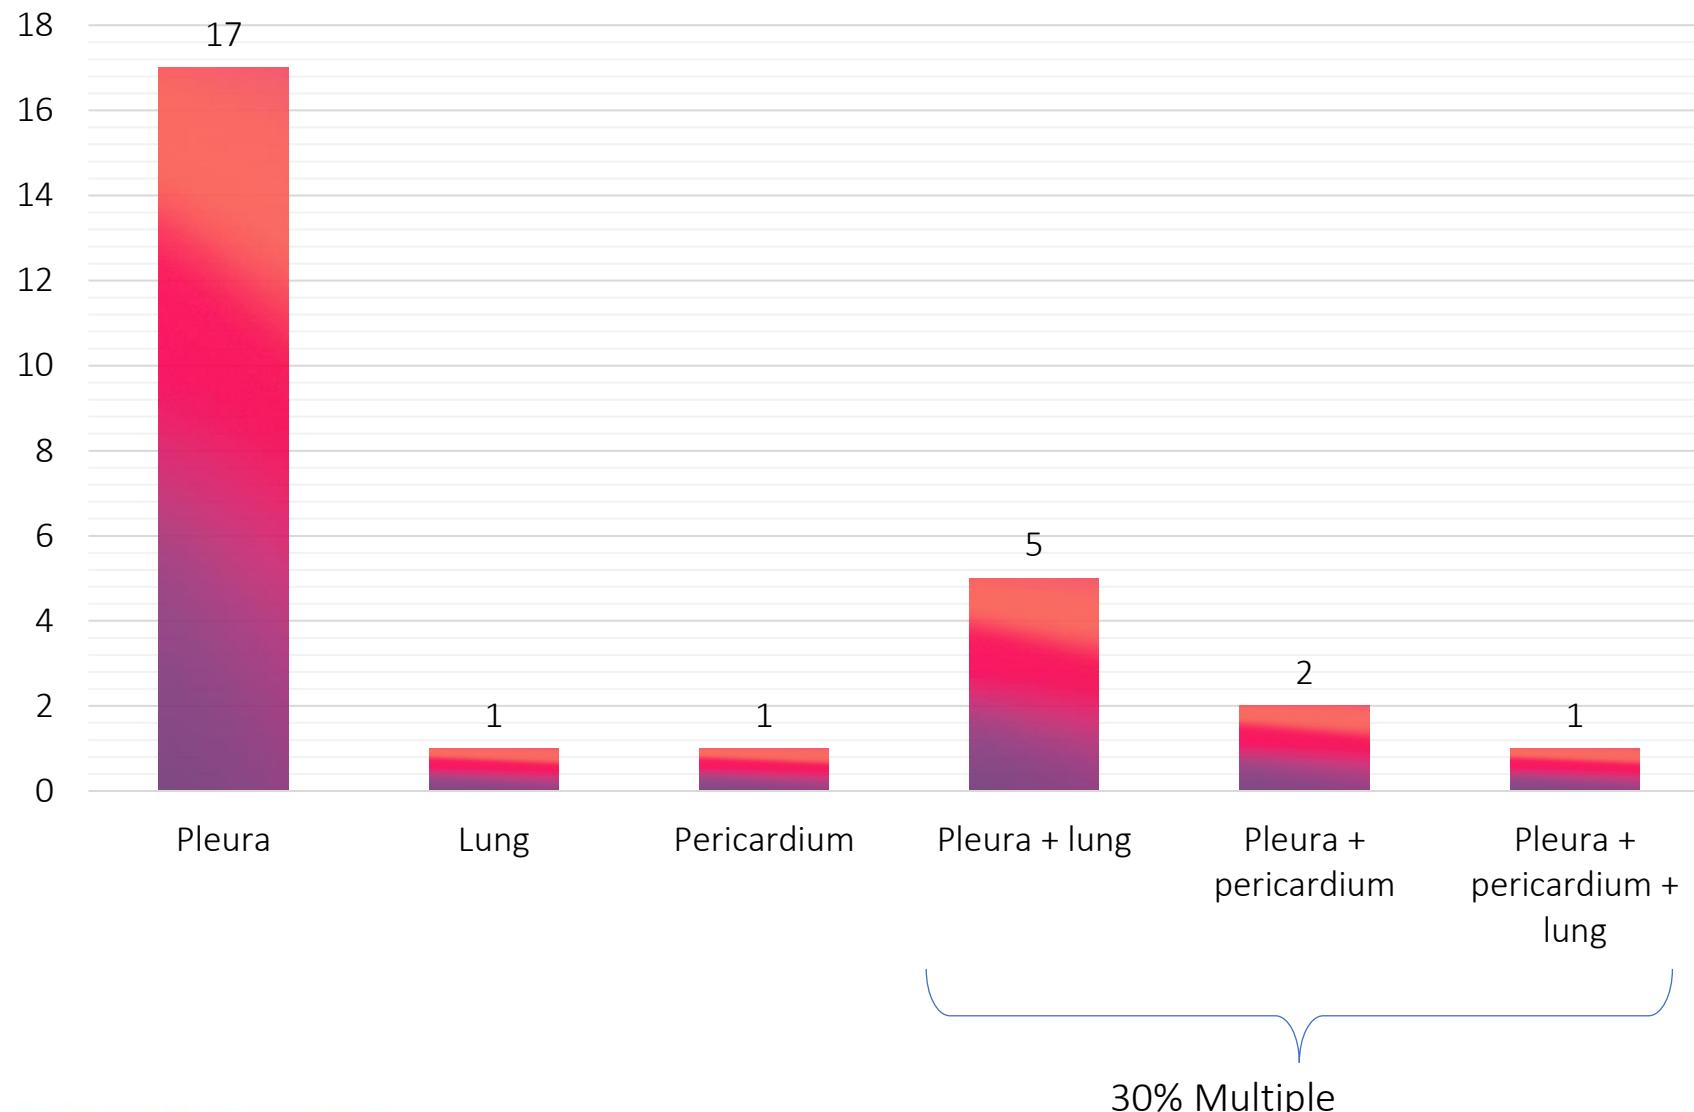

Mean time to
metastasis development

$$B3 + C = 71\%$$

All patients were operated

Material and methods

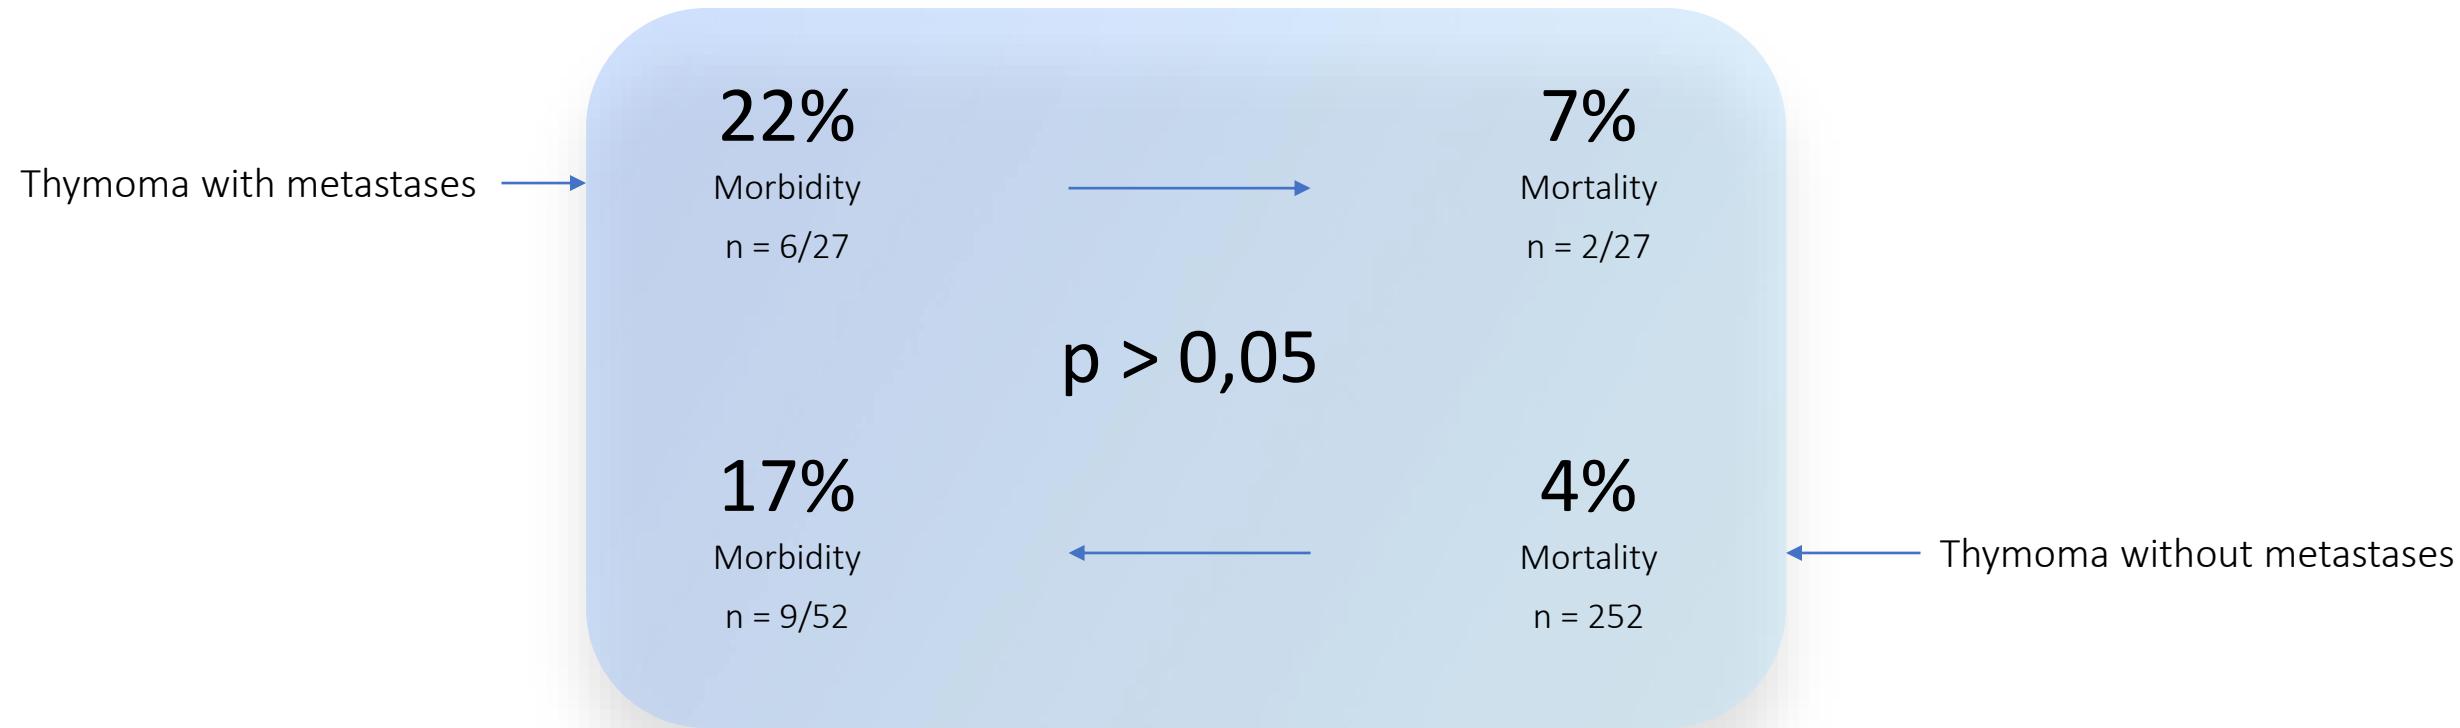

6.6 cm
Mean tumour size

3 (11%)
Myasthenia

18 (66%)
Invasion

1-year

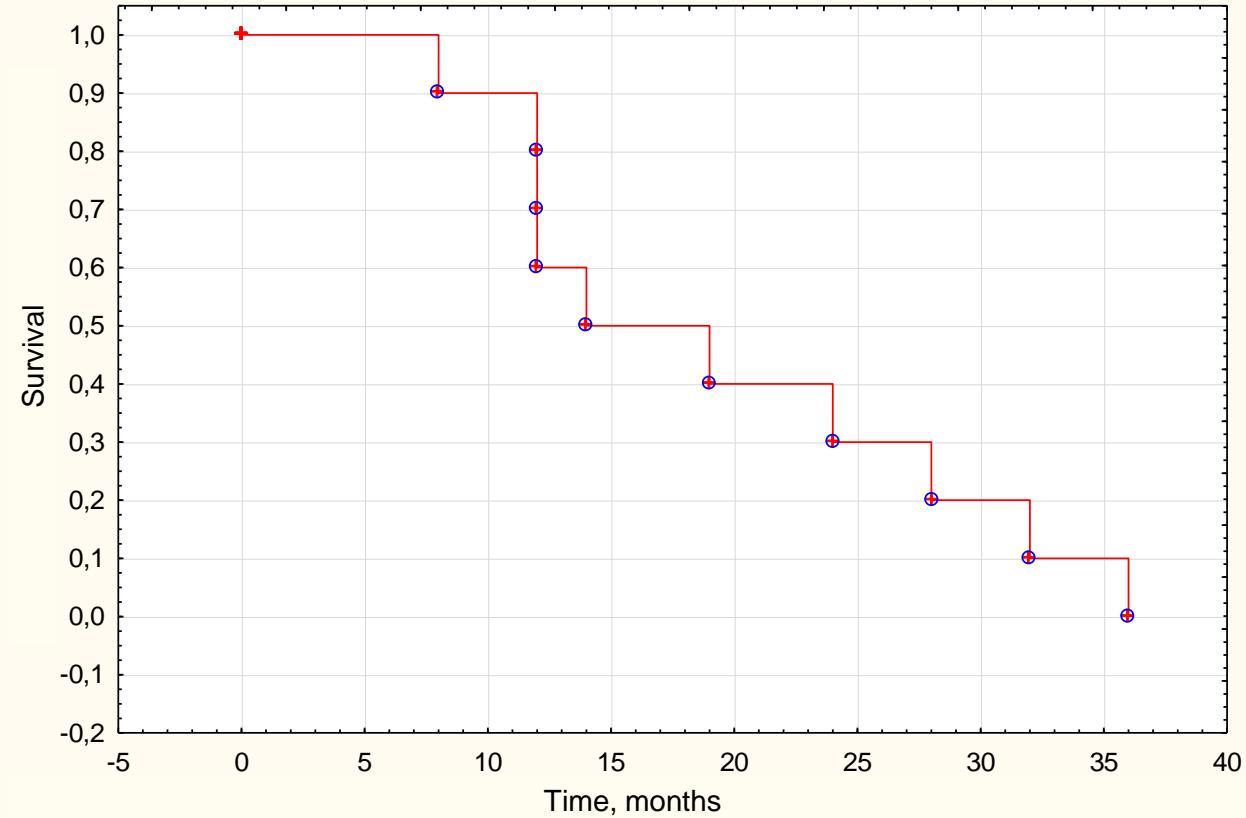

49%
3-year

41%
5-year

Me = 29 mo.

Recurrence-free survival

○ Recurrence

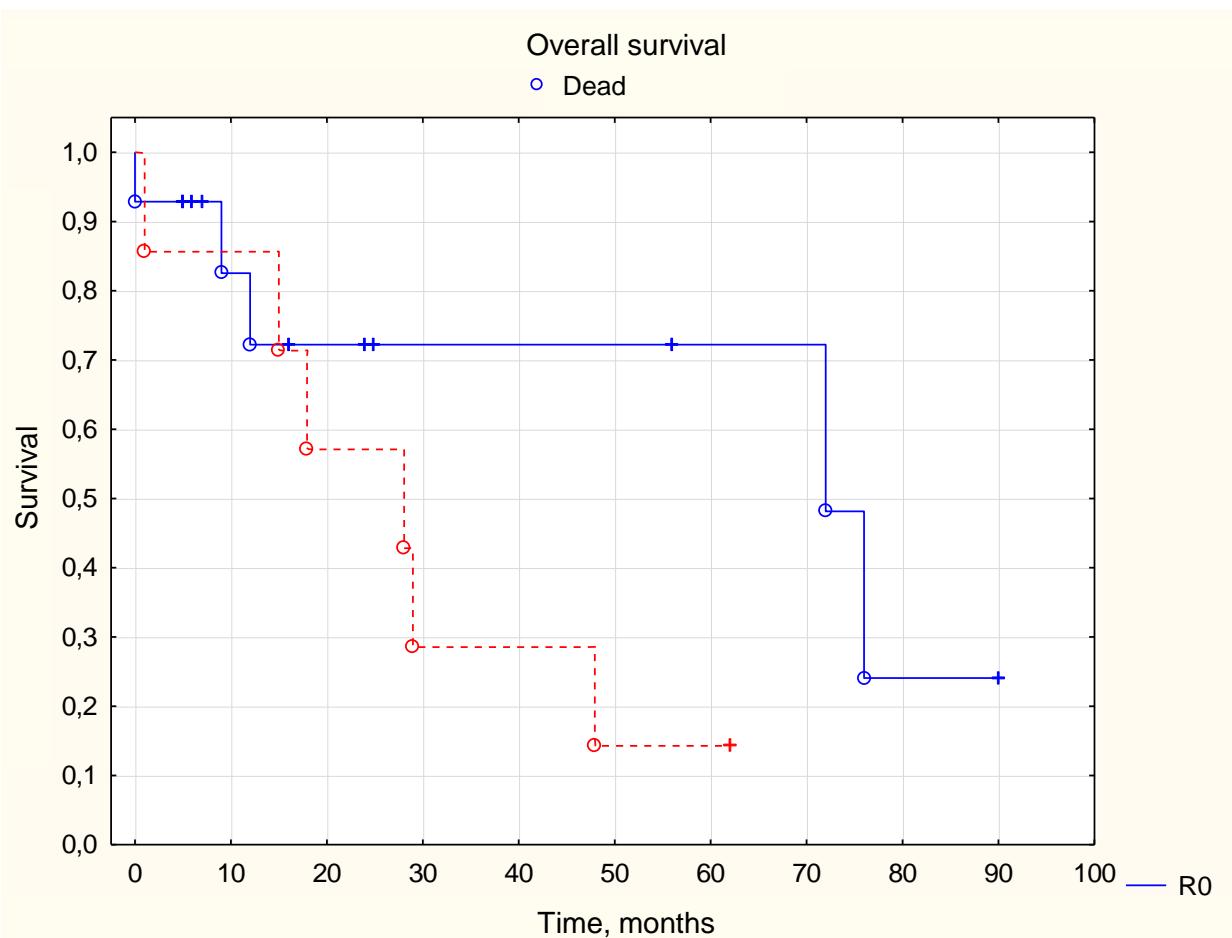

60%
1-year

* in 47% of patients

Me = 14 mo.

Results

Me in R0 = 28,9 mo. (95% CI 15,3-128,6)

Me in R1-2 = 13 mo. (95% CI 2,3-53,6)

p = 0,115

Mean tumour size in R0 = 5,4 cm (3,5-7,2 cm)

Mean tumour size in R1-R2 = 9 cm (4,6-13,3 cm)

p = 0,034

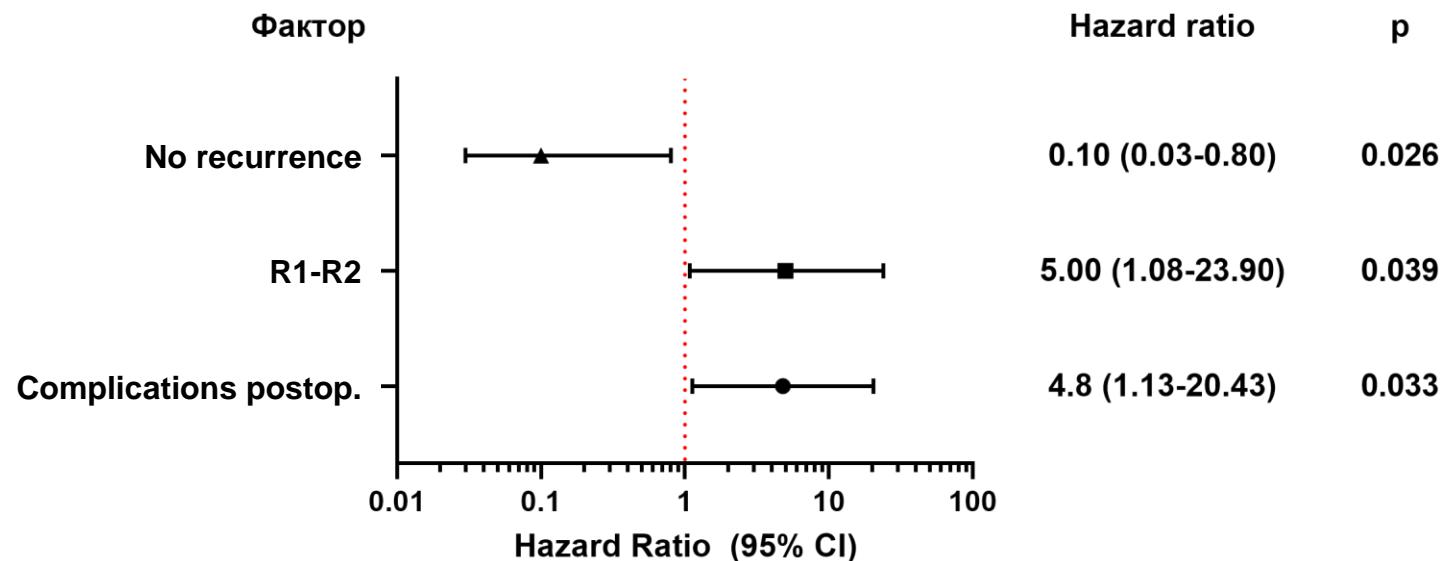

Radicality was not influenced by:

Tumour histology (p = 0,127)

Number of metastases (p = 0,274)

Location of metastases (p = 0,428)

Results

Probability of mortality is higher:

- 4,8 times in case of postop. complication
- 5 times in R—R2 operation

Probability of mortality is lower:

- 5,8 times in case of non-recurrence
